

Customer Journey Map

Project: Implement Client Script & UI Policy (Incident)

Date: _____ **Team ID:** _____

Scenario: A user creates or updates an Incident while Client Script and UI Policy logic dynamically controls field behaviour based on Incident values.

Steps / Experience	1. Open Incident	2. Enter / Change Values	3. Evaluate Conditions	4. Apply Field Behaviour	5. Verify & Submit	6. Ongoing Use
Interactions	User opens the Incident form.	User enters or changes relevant Incident fields.	Client Script and UI Policy conditions evaluate the current form values.	Fields become visible, mandatory, read-only, or are updated according to the configured rules.	User verifies the form and submits; administrator tests expected scenarios.	Users continue creating and updating Incidents while administrators maintain the configuration.
Things / Touchpoints	Incident form; application UI	Form fields; browser	Client Script; UI Policy; field values	Field visibility; mandatory/read-only states	Form validation; test cases; documentation	ServiceNow application; configuration
Places	Incident application	Incident form	Client-side form layer	Incident form	Development/test environment	Production/admin environment
People	Incident user	Incident user; form	Client Script; UI Policy	User; application	Administrator; developer; tester	Users; administrators
Positive Moments	Find the Incident form quickly.	Entering information is straightforward.	Conditions evaluate consistently.	Required fields and field states are clear.	Form behaviour is predictable and test results are clear.	Users experience consistent Incident handling.
Negative Moments	Unclear field requirements can cause confusion.	Fields may behave unexpectedly when values change.	Conflicting conditions can create uncertainty.	Incorrect field states can block or allow unintended input.	Debugging can be time-consuming.	Requirement changes may require script/policy updates.
Areas of Opportunity	Keep the form easy to navigate.	Provide immediate, clear field guidance.	Use simple, non-conflicting conditions.	Make dynamic behaviour predictable.	Provide repeatable test cases and documentation.	Keep scripts and policies maintainable.
Goals & Motivations	Help me complete an Incident without unnecessary navigation.	Help me enter valid information.	Help me understand what each field requires.	Help me see and edit only what is appropriate.	Help me submit a correct Incident confidently.	Help me use a consistent form as requirements evolve.

Reference basis: the uploaded example organizes the journey around steps, interactions, touchpoints, places, people, positive and negative moments, opportunities, and goals/motivations. ■filecite■turn1file0■L2-L6■
