

Project Design Phase

Solution Architecture

Date: _____ Team ID: _____ Project Name: Implement Client Script & UI Policy (Incident)

Maximum Marks: 4 Marks

Solution Architecture:

The proposed solution architecture bridges the Incident form requirement with client-side dynamic behaviour. A user interacts with the Incident form; configured Client Scripts evaluate relevant form data and UI Policies apply field-state rules. The resulting behaviour guides the user before submission.

Actor / Component	Interaction / Responsibility
User / Client	Creates or updates an Incident and provides field values through the form.
Incident Form	Presents fields and form events that trigger configured client-side behaviour.
UI Policy	Evaluates configured conditions and controls field visibility, mandatory status, and read-only state.
Client Script	Evaluates form data on supported events and performs required client-side validation or dynamic actions.
Incident Data	Contains the record fields whose values are used by configured conditions.
Administrator	Configures, tests, documents, and maintains Client Scripts and UI Policies.

Architecture Components and Responsibilities

Component	Responsibility in the proposed solution
User / Client	Initiates Incident creation or update and supplies the applicable form data.
Administrator / Configuration	Defines target fields, conditions, Client Scripts, UI Policies, and expected behaviour.
Client Script	Evaluates relevant form values during configured client-side events and performs validation or dynamic actions.
UI Policy	Applies mandatory, visible, and read-only field states according to configured conditions.
Incident Data Store	Contains Incident records and field values used by the form conditions.
Validation / Testing	Tests matching, non-matching, empty, unexpected, and edge-case field values before deployment.

Solution Flow

Step	Flow
1	User opens or updates an Incident form.
2	Relevant field values and form events are evaluated by the configured Client Script and/or UI Policy.
3	The configured condition is evaluated.
4	UI Policy applies field state changes; Client Script performs configured validation or dynamic actions.
5	The user corrects any required information and submits the Incident when validation succeeds.
6	Administrators test and maintain the rules as Incident form requirements change.
