

Project Design Phase-II

Technology Stack (Architecture & Stack)

Date: _____ Team ID: _____ Project Name: Implement Client Script & UI Policy (Incident)

Maximum Marks: 4 Marks

Technical Architecture:

The proposed architecture treats the Incident form as the interaction point. Client Scripts evaluate client-side form events and UI Policies control field states such as mandatory, visible, and read-only. The stack below is a proposed implementation mapping.

User / Client	Application / Configuration Layer	Data / Platform Layer
User interacts with Incident form → ServiceNow Client Script evaluates form data and UI Policy applies configured field behaviour	← Dynamic field state / validation →	Incident record and field values stored in ServiceNow

Table-1 : Components & Technologies:

S.No	Component	Description	Technology
1	User Interface	User creates or updates Incidents and interacts with form fields.	ServiceNow Web UI / Browser
2	Client Logic	Evaluates field values during supported client-side form events and performs dynamic actions.	ServiceNow Client Script + JavaScript
3	UI Behaviour	Controls mandatory, visible, and read-only field states based on conditions.	ServiceNow UI Policy
4	Administration & Testing	Configures, tests, and maintains Client Scripts and UI Policies.	ServiceNow Configuration / Admin Console
5	Data Layer	Stores Incident records and the field values used by client-side conditions.	ServiceNow Incident Table / Platform Database
6	File Storage	Optional storage for documentation or test evidence.	ServiceNow Attachments / Platform Storage
7	External API-1	No external API is required for the core form behaviour.	Not required for core solution
8	External API-2	External integrations may be added if a business requirement requires them.	Optional REST API / Integration
9	Machine Learning Model	No ML model is required for deterministic Incident field behaviour.	Not applicable
10	Infrastructure	Application execution and hosting environment.	ServiceNow Cloud Platform

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1	Frameworks	No separate application framework is required for the core implementation.	ServiceNow scripting/configuration
2	Security	Client-side controls improve form behaviour and validation; server-side controls remain necessary for authoritative security enforcement.	ServiceNow platform security controls
3	Maintainability	Clear conditions, concise scripts, and reusable configuration support future changes.	Client Scripts / UI Policies
4	Availability	Runs within the managed ServiceNow application environment.	ServiceNow-managed Cloud Infrastructure
5	Performance	Evaluate only required fields and avoid unnecessary client-side processing.	JavaScript / ServiceNow Client Scripts
