

Functional & Performance Testing Template

Model Performance Test

Date: _____ Team ID: _____

Project Name: Implement Client Script & UI Policy (Incident)

Note: Actual Result and Pass/Fail should be completed after executing each test case.

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Incident Form Load Validation	Open Incident form with valid, empty, and incomplete record data.	Valid Incident form loads; configured field behavior is available without errors.	To be filled during execution.	Pending
FT-02	UI Policy Condition Validation	Enter different Incident field values that should activate or bypass the UI Policy.	Matching values trigger the configured UI Policy; non-matching values follow the alternate state.	To be filled during execution.	Pending
FT-03	Dynamic Field Behavior	Change the controlling Incident field and observe target fields.	Visibility, mandatory, and/or read-only states change according to configuration.	To be filled during execution.	Pending
FT-04	Client Script Validation	Trigger the configured Client Script event with representative values.	Client Script executes and applies the expected client-side behavior.	To be filled during execution.	Pending
FT-05	Empty Input Handling	Clear the controlling field or required field and attempt the relevant form action.	System applies configured empty-value behavior and displays appropriate validation when required.	To be filled during execution.	Pending
FT-06	Form Submission Check	Complete an Incident using valid and invalid field combinations and submit.	Valid combinations submit successfully; invalid combinations are prevented or handled according to configuration.	To be filled during execution.	Pending
FT-07	Error Handling	Simulate invalid/unexpected field values or script conditions.	Clear client-side handling occurs without crashing the form.	To be filled during execution.	Pending
FT-08	Behavior Consistency	Repeat the same condition changes across multiple Incident records.	Configured UI Policy and Client Script behavior remains consistent.	To be filled during execution.	Pending
PT-01	Form Response Time Test	Measure time from changing the controlling field to visible UI state update.	Configured field state updates promptly without unacceptable delay.	To be filled during execution.	Pending
PT-02	Repeated Field Change Test	Change the controlling Incident field repeatedly and monitor form responsiveness.	Repeated UI updates complete without freezing or significant degradation.	To be filled during execution.	Pending
PT-03	Repeated Incident Form Load Test	Open and reload Incident forms repeatedly during a test period.	Forms remain responsive and configured scripts/policies continue to execute.	To be filled during execution.	Pending
PT-04	Large Form/Input Load Test	Test Incident records with supported large text or multiple populated fields.	Supported data loads and behavior remains responsive; unsupported input is handled gracefully.	To be filled during execution.	Pending
PT-05	Multiple Form Interaction Test	Perform multiple field changes and UI actions in succession.	The form remains stable and field states remain consistent.	To be filled during execution.	Pending
PT-06	Concurrent User Simulation	Simulate multiple users interacting with Incident forms using the configured behavior.	Application remains responsive and client-side behavior operates as configured for each session.	To be filled during execution.	Pending
