

Project Development Phase

Performance Test – Tableau

Date: _____ Team ID: _____

Project Name: Implement Client Script & UI Policy (Incident)

Model Performance Testing: Project team shall fill the following information in the model performance testing template.

S.No.	Parameter	Screenshot / Values
1	Data Rendered	ServiceNow Incident form data rendered for the Client Script and UI Policy test scenario. Verify that the Incident record and target field values are available for evaluation.
2	Data Preprocessing	Validate the controlling Incident field value and form context before UI Policy/Client Script evaluation. Handle missing, empty, invalid, or unexpected field values according to the configured behavior.
3	Utilization of Filters	Use Incident field-value conditions as the effective filters for UI behavior. Field visibility, mandatory state, or read-only state is applied based on the configured condition.
4	Calculation fields Used	No Tableau-style calculated field is required for the core Incident form solution. Equivalent condition and behavior logic is implemented through ServiceNow UI Policy and Client Script configuration.
5	Dashboard design – No. of Visualizations / Graphs	Not applicable to the core Incident form implementation. For validation, an optional monitoring view may summarize test cases, field states, response observations, and validation results.
6	Story Design – No. of Visualizations / Graphs	Not applicable to the core Incident form implementation. If used for demonstration, a simple story can show Incident open → condition evaluation → UI Policy/Client Script action → field state → validation flow.

Project-specific note: The supplied template is organized around data rendered, preprocessing, filters, calculation fields, dashboard design, and story design. For this Incident project, those fields are mapped to form rendering, condition evaluation, dynamic field behavior, and validation rather than a Tableau visualization implementation.
