

Project Design Phase

Problem – Solution Fit

Date: _____ Team ID: _____ Project Name: Implement Client Script & UI Policy (Incident)

Maximum Marks: 2 Marks

1. Customer / Target Group	2. Problem / Pain	3. Existing Situation / Behavior
Incident users and administrators responsible for configuring and maintaining the Incident form.	Incident form behaviour may need to change based on field values. Without clear dynamic controls, users may miss required information or interact with fields in an unintended state.	Users create and update Incidents through the existing form. Administrators configure form behaviour and must test how different field values affect visibility, mandatory status, and read-only state.
4. Proposed Solution	5. Problem–Solution Fit	6. Expected Customer / User Outcome
Use Client Scripts and UI Policies to evaluate defined Incident conditions and dynamically control field values and field states.	The solution directly addresses the form-behaviour problem because Incident field values and conditions become explicit inputs to the Client Script/UI Policy logic. Matching conditions produce the configured field behaviour.	Users receive clearer form guidance and consistent field states. Administrators gain configurable and testable mechanisms for dynamic Incident form behaviour.
7. Adoption / Existing Medium or Channel	8. Triggers / Frequent Annoyances	9. Improvement / Validation Focus
Use the existing ServiceNow Incident form and configuration mechanisms. No separate user channel is required for the core solution.	A relevant field changes; an Incident enters a particular state or category; required information is missing; or business requirements change.	Test representative Incident values and user actions, including matching, non-matching, empty, and unexpected values, and verify the resulting field behaviour.

Problem–Solution Fit Check

Fit Check	Project-specific evidence / validation
Problem is relevant	Incident form behaviour is tied to field data and business conditions, so field states can materially affect form completion.
Solution addresses the problem	Client Scripts and UI Policies evaluate relevant conditions and apply the intended field behaviour.
Behavioral fit	The solution works within the existing Incident form workflow rather than requiring users to learn a separate mechanism.
Customer outcome	Users receive appropriate field guidance; administrators can configure and test the rules.
Validation needed	Test representative Incident records, field values, form events, user actions, and edge cases to confirm intended behaviour.
